

**Omnix** is the market leader in enterprise transport management software in Australia. The core component to the SmartMove Suite is our browser based menu's and administration module, MenuSmart. With the release of MenuSmart 4.2, we have provided the following

### Enhancements

- Menu items can be configured to open in a new browser tab
- Menu items for a user can be limited based on the user's role and selected depot and database.
- User can swap between multiple databases/depots without having to log back in
- User only has visibility of authorised database & depots
- Literal database name shielded from user by an assigned intuitive name

### Administration

- web based menu administration
- intuitive configuration of users and menu items
- add/remove/reorder menu items (include your own Crystal Reports)
- change user's passwords
- create, maintain and assign roles that control depot, database and menu item access
- depots are retrieved live from the associated databases

### Bug fixes

- More intuitive icons
- Favourites (shortcuts) now also delete properly

Selected depot will have no affect on the invoked behaviour of menu items until 4.2 is fully installed – however selected depot can still be used to restrict available menu items.
